

# PDF example with table

## A PDF document using Quarto

In the code below, we fit several models and then use the `{modelsummary}` package to print a nicely formatted table with minimal effort:

```
library(modelsummary)

url <- 'https://vincentarelbundock.github.io/Rdatasets/csv/HistData/Guerry.csv'
dat <- read.csv(url)

models <- list(
  "OLS 1"      = lm(Donations ~ Literacy + Clergy, data = dat),
  "Poisson 1"  = glm(Donations ~ Literacy + Commerce, family = poisson, data = dat),
  "OLS 2"      = lm(Crime_pers ~ Literacy + Clergy, data = dat),
  "Poisson 2"  = glm(Crime_pers ~ Literacy + Commerce, family = poisson, data = dat),
  "OLS 3"      = lm(Crime_prop ~ Literacy + Clergy, data = dat)
)

modelsummary(models)
```

And an equation, for good measure:

$$\begin{aligned} S(\omega) &= \frac{\alpha g^2}{\omega^5} e^{[-0.74 \left\{ \frac{\omega U_\omega 19.5}{g} \right\}^{-4}]} \\ &= \frac{\alpha g^2}{\omega^5} \exp \left[ -0.74 \left\{ \frac{\omega U_\omega 19.5}{g} \right\}^{-4} \right] \end{aligned}$$

	OLS 1	Poisson 1	OLS 2	Poisson 2	OLS 3
(Intercept)	7948.667 (2078.276)	8.241 (0.006)	16 259.384 (2611.140)	9.876 (0.003)	11 243.544 (1011.240)
